

Cairns Regional Council Water Monitoring

NORTH QUEENSLAND

THE PROJECT

Cairns Regional Council required several enclosures to house their level monitoring stations which were being installed to monitor their water supply.

A number of enclosures were needed to meet specific requirements and specifications. This included being corrosion resistant, as they would be installed in areas susceptible to high humidity and salinity. The enclosures were also required to be resistant to vandalism, as they were being installed in a public area.

B&R Enclosures were able to supply a 316 stainless steel, **Universal NI** enclosures with vent kits and a heavy-duty locking mechanism.

By working closely with B&R Enclosures, the principle contractors were able to deliver the project requirements in accordance with the specifications and time constraints. The level monitoring stations have been installed and are working well.
